Website Hosting & Deployment

Proposal for Right Concept — prepared by 24dev

1 August 2026

---

1. What this proposes

Right Concept **owns** the hosting infrastructure. 24dev **operates** it.

- The Cloudflare account is created by, and registered to, **Right Concept**
- The GitHub organisation is owned by **Right Concept**
- 24dev is added as a **team member** — access that Right Concept grants, and can revoke at any time
- Every website, domain and deployment sits inside Right Concept's own account

If this arrangement ends at any point, Right Concept changes one password. Nothing moves, nothing is migrated, no site goes offline, and no data is held by anyone else. There is no lock-in by design.

This is the core of the proposal. Everything below is detail.

---

2. Why this came up

The websites 24dev builds are **modern framework applications** (Next.js / React), not WordPress.

This is a deliberate choice — it is why these sites load faster, score better in Google's Core Web Vitals, and rank better for local search terms.

It also means they **cannot run on standard shared hosting.** Shared hosting runs PHP. These sites need a JavaScript runtime and a build step. This is not a limitation of Hostinger — Hostinger is very good at what it is built for. It is simply a different category of hosting.

So the question is not "which host is cheaper." It is **"which host can run these sites at all."**

---

3. Honest cost comparison

Hostinger (current)

Plan	Introductory price	Notes
Premium	₹139/month	Multiple websites on one plan
Business	₹199/month	Adds CDN and priority support
Cloud Professional	₹849/month	Up to 300 websites

Important and in Hostinger's favour: one plan hosts many websites. Ten sites do **not** cost ten times as much. Renewal rates are higher than the introductory rates shown.

Cloudflare

Item	Cost
Pages (hosting)	**₹0**
Bandwidth	**₹0 — unlimited, at every tier**
Builds	500/month included free
SSL certificates	₹0
Global CDN	₹0
DDoS protection	₹0 (enterprise-grade)
Team members	₹0

For 5–10 websites

	Hostinger	Cloudflare
Monthly cost	₹199–₹849 depending on plan	**₹0**
Annual cost	₹2,400–₹10,200	**₹0**

Being straight about this: the saving is real but modest — a few thousand rupees a year. **Cost is not the main reason to move.** The reasons below are.

4. The reasons that actually matter

It can run the sites

Shared hosting cannot execute a Next.js build. On Cloudflare it runs natively. This is the deciding factor — the rest is improvement, this is capability.

Speed

	Hostinger	Cloudflare
Delivery	From one datacentre	330+ cities worldwide, several in India
A Chennai visitor	Served from the origin server	Served from a nearby Indian city

For local-search businesses — which is most of these clients — page speed directly affects Google ranking. A buyer in Coimbatore searching "SS pipe supplier" gets a faster page, and Google notices.

Bandwidth and traffic

Cloudflare does **not meter bandwidth at any tier.** Shared hosting advertises "unlimited" bandwidth but enforces CPU and resource limits — a site that suddenly gets traffic can be throttled or suspended.

Realistic traffic expectations for a B2B manufacturer website:

Scenario	Monthly visits	Hostinger	Cloudflare
Newly launched	200 – 1,000	Fine	Fine
Established, ranking locally	2,000 – 10,000	Fine	Fine
Ranking well / running ads	20,000 – 50,000	CPU limits may throttle	Fine
Viral post or campaign spike	100,000+	Likely suspended	Fine

These are industry-typical ranges for B2B manufacturer sites, offered as planning estimates — not measurements of any specific Right Concept client.

The point is not that today's traffic is a problem. It is that **success becomes a problem** on shared hosting, and never does on Cloudflare.

Deployment

	Hostinger	Cloudflare
Publishing a change	Manual file upload via FTP	Automatic
Time to go live	Manual, whenever someone is free	~60 seconds, automatic
Record of changes	None	Every change logged and reversible
Rollback if something breaks	Restore from backup	One click, instant

Security

Free SSL on both. Cloudflare additionally provides enterprise-grade DDoS protection and a web application firewall at no cost — the same infrastructure protecting major global platforms.

---

5. What Right Concept does, and what 24dev does

Right Concept

- Creates and owns the Cloudflare and GitHub accounts
- Owns all domains, as now
- Adds 24dev as a team member
- Can review, audit or revoke access at any time

24dev

- Connects domains and configures DNS
- Sets up and maintains the deployment pipeline
- Monitors uptime and resolves issues
- Manages SSL and build configuration
- Hands over full source code on project completion, as agreed

---

6. Content updates

These sites are **CMS-ready.** A content management system can be added so your team edits text, prices and images directly, without a developer — changes publish automatically in about a minute.

This is available as a separate piece of work, scoped when required. It is not included in hosting.

---

7. Migration

No downtime, no risk to any live site.

1. Right Concept creates the Cloudflare account and adds 24dev
2. 24dev deploys the site and provides a test URL
3. Right Concept reviews it fully
4. **Only after approval,** the domain is pointed across
5. The switch is a DNS change — the existing site stays live throughout and is only replaced once the new one is confirmed working

If anything is wrong at any stage, we stop. The current site is untouched until the final step.

---

8. Commercial terms

No charge for hosting management for the **first three months**, so the arrangement can be judged on results rather than promises.

After that, a small monthly maintenance retainer — scoped to the number of sites — covering uptime monitoring, deployments, SSL, and support response.

Hosting costs on Cloudflare remain **₹0** regardless.

---

9. Recommendation

For any website 24dev builds: Cloudflare. Shared hosting cannot run these applications, so this is a technical requirement rather than a preference.

For existing WordPress websites: keep them on Hostinger. It is well suited to them and there is no reason to move them.

The two are not in competition. They are for different types of website, and Right Concept can reasonably use both.

Prepared by 24dev

Happy to walk through any of this on a call.
