Bharat Stainless Steel Industries

Breadcrumb: Home / Resources

Section 1: Hero Section

Headline: Stainless Steel Weight Calculator & Grade Comparison Tool

Sub-Headline: Two free tools built for real orders - estimate weight accurately and confirm the right grade before you message us for a price.

CTA: Try the Weight Calculator ↓ → anchor-links to #weight-calculator (Section 3) on the same page

---

Section 2: Intro

Headline: What These Two Tools Do

Sub-Headline: A quick explainer of what each tool does, so you use the right one before placing your next order.

Body: Bharat Stainless Steel Industries's Resources page offers two free tools: a stainless steel weight calculator for pipes, coils, and sheets using correct grade-specific density values, and a grade comparison tool covering SS 202 vs SS 304 vs SS 316 - corrosion resistance, nickel content, and best-fit applications for each.

Section 3: Weight Calculator

Headline: Estimate Your Stainless Steel Weight

Sub-Headline: The exact formulas we use ourselves, so your estimate matches what actually shows up on the weighbridge, not a generic mild-steel guess.

Body: Estimate the weight of stainless steel pipe, coil, or sheet before you order - using correct industry formulas for 300-series SS (density 8.00 g/cm³), not a generic mild-steel shortcut that quietly underestimates weight by close to 2%.

Hollow pipes/tubes: Weight (kg/m) = (OD − Wall Thickness) × Wall Thickness × 0.02491 Flat sheets/plates: Weight (kg) = Length(m) × Width(m) × Thickness(mm) × Density (8.00 for 300-series, 7.75 for 400-series)

(Dev note: interactive calculator - input fields for shape, dimensions, grade → instant estimated weight output)

Knowing estimated weight before ordering lets you compare supplier quotes on a like-for-like basis, plan freight and handling, and cross-check your delivered invoice against expectation.

Result panel CTA: Get Exact Price for This Spec on WhatsApp - *pre-filled with calculated dimensions and grade.*

Section 4: Grade Comparison Tool

Headline: Grade Comparison Tool (SS 202 vs 304 vs 316)

Sub-Headline: SS 202, 304, and 316 can look identical on the shelf, this table breaks down what actually separates them, so you order the right one the first time.

Body: SS 202, 304, and 316 can look identical when new but differ in nickel content, corrosion resistance, and long-term performance, getting it wrong can mean replacing a component within a year or two instead of a decade.

Grade	Nickel Content	Corrosion Resistance	Corrosion Resistance
SS 202	Lower	Moderate - can show rust over time in humid/wet conditions	Indoor use, less corrosive-exposure applications, cost-sensitive projects
SS 304	Higher	Strong - handles moisture, cleaning chemicals well	Dairy, food processing, general industrial and outdoor use
SS 316	Highest (with molybdenum)	Strongest - resists chlorides, salt, and harsh chemical exposure	Chemical plants, high-exposure or corrosive-environment applications

Comparison-view CTA: Confirm the Right Grade for Your Order on WhatsApp - *tell us your application, we'll tell you plainly which grade fits, even if it means recommending the cheaper option.*

Link (pre-filled whatsapp message): wa.me/918199950046?text=Hi%2C%20I%27d%20like%20help%20confirming%20the%20right%20SS%20grade%20(202%2F304%2F316)%20for%20my%20application.

Section 5: Browse by Product

Headline: Already Know Your Grade?

Sub-Headline: Skip the calculator and comparison table, go straight to the product page for specs and pricing.

Body: [Stainless Steel Round Pipes] · [Stainless Steel Coils] · [Stainless Steel Sheets]

CTA 1: Stainless Steel Round Pipes → /products/pipes-tubes/stainless-steel-round-pipes

CTA 2: Stainless Steel Coils → /products/coils-strip/stainless-steel-coils

CTA 3: Stainless Steel Sheets → /products/sheets/stainless-steel-sheets

CTA Final: See all products → /products (Products Hub)

Section 6: Honest-Weight/Tolerance Note

Headline: Why Delivered Weight Varies From the Calculator

Sub-Headline: A straight answer to the most common post-delivery question we get, before you even have to ask it.

Body: Actual delivered weight can differ slightly from this calculator's theoretical number, due to standard rolling tolerances (IS 1852 / ASTM A6) that apply industry-wide. We bill every order on actual Dharam Kanta (weighbridge) weight.

Section 7: FAQs

Headline: Frequently Asked Questions

Sub-Headline: The weight and grade questions our buyers ask most, answered in plain language.

Body:

FAQs 1: How do I calculate the weight of a stainless steel pipe?
Answer: Weight (kg/m) = (OD − Wall Thickness) × Wall Thickness × 0.02491, using this calculator with your specific OD and wall thickness.

FAQs 2: What is the density of stainless steel?
Answer: Approximately 8.00 g/cm³ for 300-series (like SS 304, 316) and approximately 7.75 g/cm³ for 400-series - using the wrong density (e.g., a generic mild-steel figure) underestimates weight by a meaningful margin.

FAQs 3: Which is better, SS 202 or SS 304?
Answer: Neither is universally "better" - SS 202 is more economical for indoor, lower-exposure use; SS 304 costs more but resists moisture and chemical exposure significantly better over years of use. The right choice depends on your application.

FAQs 4: Why does my calculated weight not match what I was billed for a past order (from another supplier)?
Answer: Standard rolling tolerance means actual thickness, and therefore weight can vary slightly from theoretical calculation; this is industry-wide, governed by standards like IS 1852/ASTM A6, not something specific to one supplier. What matters is whether the supplier weighed and billed you on actual delivered weight, which is what BSSI does on every order.

Section 8: Bottom CTA

Headline: Have your spec ready?

Sub-Headline: Whether you used the calculator or already know your spec, the next step is the same.

CTA: Message Us on WhatsApp for Today's Price
