QCred.in

Credit. Credibility. Confidence

FEEDBACK UPDATE · 3 AUGUST 2026, EVENING

All six of today's points, actioned

And five questions to lock before go-live

Your second round of feedback from this afternoon has been built, deployed and tested — including the two pages that were failing for your RM. This document shows what changed, explains one setting on your side, and lists the specific decisions we need from you so nothing is built on a guess.

PREPARED FOR	PREPARED BY	DATE	LIVE AT
QCred.in Simply Insights LLP	24dev Prabhas Raju	3 August 2026	qcred-crm.vercel.app

SECTION 01

Today's six points — status

In the order they appear in your document (17:05 additions).

#	Your point	Status	What was done
13	In hierarchy, one should see data belonging to their own team only	✓ Built	Every employee now carries a **"Reports to"** setting on the Employees screen. A role whose data access is set to **Team** sees records assigned to themselves and everyone below them in that reporting line — enforced inside the database query, so out-of-team records are never even sent to the browser.
14	Indication that the app is working; should say "Updated"	✓ Built	Every save button across the CRM and partner portal now shows **"Saving…"** with a spinner while working and flashes **"Updated ✓"** when finished. Buttons also lock while saving, which prevents accidental double-submissions.
15	New employee should go for approval — supervisor of the adder, or checker from corporate office	✓ Built	A newly added or invited employee **cannot sign in** until approved. Both routes you named work: the supervisor of whoever added them can approve, and so can anyone holding the new *employees — approve* permission (your Checker and corporate roles have it). Pending approvals appear in the approver's to-do the moment they log in. Everyone who already exists was marked approved, so no current login was affected.
16	Similar screen for Partners as well *(with the Employees role grid attached)*	✓ Built	The Partners screen now opens with the same **Access levels** grid: each partner login role with its permission count and how far it can see, plus your four field tiers with live counts. It also makes the key distinction visible — the *tier* places someone in the network, the *role* decides what their login can do.
17	Active Partner page in RM section not working	✓ Fixed	Both were the same defect and it was ours. Dashboard cards were shown to every role even when the page behind them was restricted, and a restricted page crashed instead of explaining. Now: cards a role cannot open simply don't appear, and anyone reaching a restricted address gets a clear page — *"access hasn't been granted to you, ask your administrator for [permission]"* — instead of an error. **One note on your side:** see Section 2.
18	Active Payout page in RM section not working	✓ Fixed	

Verification, same standard as before

All changes were tested on the live deployment: 49 platform checks, 21 checks on the earlier feedback round, 19 on the lender catalogue, 11 on your coding framework — plus a fresh crawl of every screen under five different logins (admin, maker, checker, partner, pending connector) looking for errors: **zero failures**. The employee-approval flow was tested end to end: invited, blocked at login, visible in the approver's queue, approved, signed in.

SECTION 02

One setting on your side, and five questions

Why your RM couldn't see Partners — two causes, both now resolved

The crash was our defect, fixed as above. But there was a second layer: the RM role's *partners — view* permission had been switched off in Settings → Roles during yesterday's exploration of the permission screens. That's easily done while trying things out — the screen applies changes immediately. We have restored the RM role to its original permission set, so your RM logins now see Partners again.

Worth knowing: every permission change is recorded in the audit trail with who and when, so this is always reconstructable. If you'd like, we can add a confirmation step before role permissions change — say the word.

Questions we need answered — so nothing is built on a guess

Each of these changes real behaviour. One-line answers are enough.

1 · Which roles should see team-only data?

The machinery is live. Today: RM and Maker see **own records**, managerial roles see **all**. Tell us which roles should switch to **team** (own + everyone reporting to them) and we'll set them — or you can, in Settings → Roles, once you confirm the intent.

2 · Who counts as "corporate office" for employee approvals?

We've granted approval rights to **Checker, National Business Head and Super Admin**. Should anyone else hold it — Divisional Managers, for instance?

3 · Region for the lender catalogue — states, or zones?

The lender funnel currently narrows by **state** (Maharashtra, Karnataka…). If your team thinks in **zones** (North / South / West / East), we'll switch the first step. With 100+ lenders coming this choice decides how useful the funnel is day-to-day.

4 · Bonus slabs — best slab, or stacking?

Target bonuses currently apply as **best-slab-wins** (reach ₹1 Cr, the whole month earns the higher rate). If any of your lenders' schemes **accumulate** tier by tier instead, tell us which — it changes payout arithmetic and must be right before real money runs.

5 · Partner share and TDS percentages

Auto-calculated payouts currently use **60% partner share** and **5% TDS** as placeholders. Please confirm your real figures — including whether share differs by tier (Sub-DSA vs Connector).

Still open from earlier rounds

Decision	Where it stands
Domain — e.g. `crm.qcred.in`	Needed to complete "live on your domain". One DNS entry on your side.
QCred-owned database & storage	Your go-ahead to create them, so live customer data starts in your accounts.
BH or SH in partner codes	Your framework uses both; we've used BH. It's a setting — confirm before the network grows.
Training module scope	The §4 activation gate is live. Videos + tracked completion: to scope once screens are final.

Where this leaves us

Both feedback rounds — nineteen numbered points — are fully actioned except the training videos, which wait on your sign-off of the screens by design. The platform is stable across every screen and role we can test. The five questions above and the domain are what stand between here and your team using this on your own address.
